You can find an image tutorial at www.tutsplus.com/tutorials/photoshop-quick-tips-using-the-layers-panel-to-edit-your-images-and-videos/ The tools you need to manipulate image files include the layers palette and the tools palette. You can find instructions on how to use the tools palette in this chapter, and Photoshop Elements tutorials are listed in Chapter 7. Chapter 6 explains the layer palette and how to use layers and layers in Photoshop to create and edit. It's possible to manipulate an image in the absence of layers, as I outline in the next section, but use of layers helps you identify what you have or haven't done with an image and save you time in the long run. In Photoshop and Photoshop Elements, you can read from top to bottom through the layers in an image, one at a time, applying or undoing edits. After working with layers in Photoshop for a while, you realize how much more you can accomplish by just seeing what's in a single layer! Manipulating Your Images with Layers Of the many features of Photoshop, the layer tools and layer palette are perhaps the most important because your ability to create, alter, and combine layers will determine how easy or difficult it is for you to edit images. Exploring Layer Basics One of the keys to effective image manipulation is the knowledge that you can create and manipulate individual layers. A layer is an object in an image that you can manipulate as you see fit. In Photoshop, you can add layers in different ways; you can create a new layer, or you can make an existing layer into a new layer. When you copy an object from one place to another in an image, the object moves from the original layer to the new layer. If you want to be sure that the object appears only on the original layer, make a copy of the object on a new layer and make the copy the new layer. To make a copy of an object on a layer, choose Layer⇒Duplicate Layer. The original copy is placed on top of the original layer, and the new layer is placed on top of the original layer. Figure 6-1 shows a simple image in which the top layer is the copy of a car on a new layer, and the bottom layer is the original car layer. Image courtesy of www.tutsplus.com Illustration by Wiley

Q: Appending to a dataset I'm trying to take a bunch of images that I have, add a watermark on them, then append them to a csv with Python. I'd like to only have the image name, the added watermark on each image, then have a line break in between them. So far, I have: ""Create the folder for storing the dataset"" os.mkdir('C:\Users\Ngawang\Desktop\images') ""Download the content of a folder"" for file_name in os.listdir('C:\Users\Ngawang\Desktop\images'): print(file_name) ""Create the dataset in OpenCV"" dataset = cv2.VideoCapture(file_name) while True: img = dataset.read() _, img_height, img_width = img.shape[:3] # Create a window cv2.namedWindow('Mywindow', cv2.WINDOW_NORMAL) # Capture the frame-by-frame cv2.imshow('Mywindow', img) # Press 'q' key on keyboard to exit the window if cv2.waitKey(1) & 0xFF == ord('q'): break # Read and display the current frame's ROI success, frame = dataset.read() roi = frame[100:700, :] cv2.imshow('Mywindow', frame) # Display the frame while it's being processed while True: # Capture the frame-by-frame cv2.imshow('Mywindow', frame) # Use Laplacian to detect the edge pixels of the image ret, threshed = cv2.threshold(frame, 0, 255, cv2.THRESH_BINARY) # Print all the detected lines cv2.imshow('Mywindow', threshed) # Print the number of lines detected # cv2

Is it possible to reverse the effects of thymectomy on the in vitro proliferation of lymphocytes in rats? The study was undertaken to investigate the possible effect of thymus on the in vitro lymphocyte proliferation (LP). Forty adult female outbred rats were divided into four groups: sham-operated group (n = 10), thoracic thymectomy group (n = 10), left cervical thymectomy group (n = 10) and control group (n = 10). The LP of spleen cells in different groups was evaluated on the 8th day after operation. Lymphocyte stimulation index (LSI) and inhibition index (LSIi) were used to analyse the LP and the result was compared. Lymphocyte proliferation in thoracic thymectomy group was found lower than the control group and left cervical thymectomy group. However, all the three thymectomy groups showed higher LSIi value than sham-operated group. The LSI and LSIi of thoracic thymectomy group were found lower than those of the left cervical thymectomy group and control group. There was significant difference in the LSI between the sham-operated group and the left cervical thymectomy group. The results suggested that thymectomy had an inhibitory effect on the proliferation of lymphocytes. Therefore, the reverse effect caused by thymectomy and the effect of "autoimmune reaction" on the proliferation of lymphocytes are still unclear
